

Part 1: Entity Counts using Kafka and Elastic

For instructions on how to run the project, see README Part 2.md

Data Source:

Reddit: Comments from r/gaming. r/gaming was chosen because I find games interesting, and there are a lot of unique names, so I felt it would fit a named entities task.

Results Explanation:

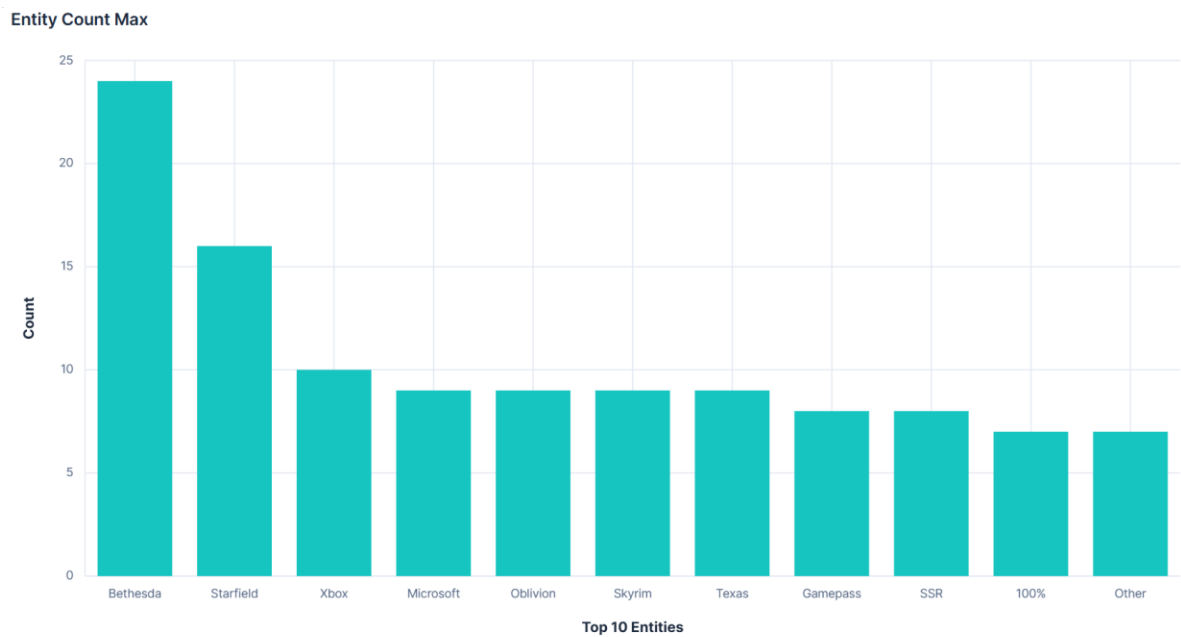

The results show that the most talked about entity is Bethesda, which is a famous game studio and the creators of the Skyrim game series. Oblivion is one of those games. Starfield is also a game by Bethesda. In the results, we see that Bethesda, Skyrim, Starfield, and Oblivion are all there. This makes sense because a few days ago Bethesda released a new Skyrim game and it's very famous right now. So, these results are exactly as expected. We also see Nintendo in the results, and this also makes sense because Nintendo announced the Switch 2 recently. The other terms are all general terms related to game technology, and I don't think they are related to any specific events.

Snapshots:

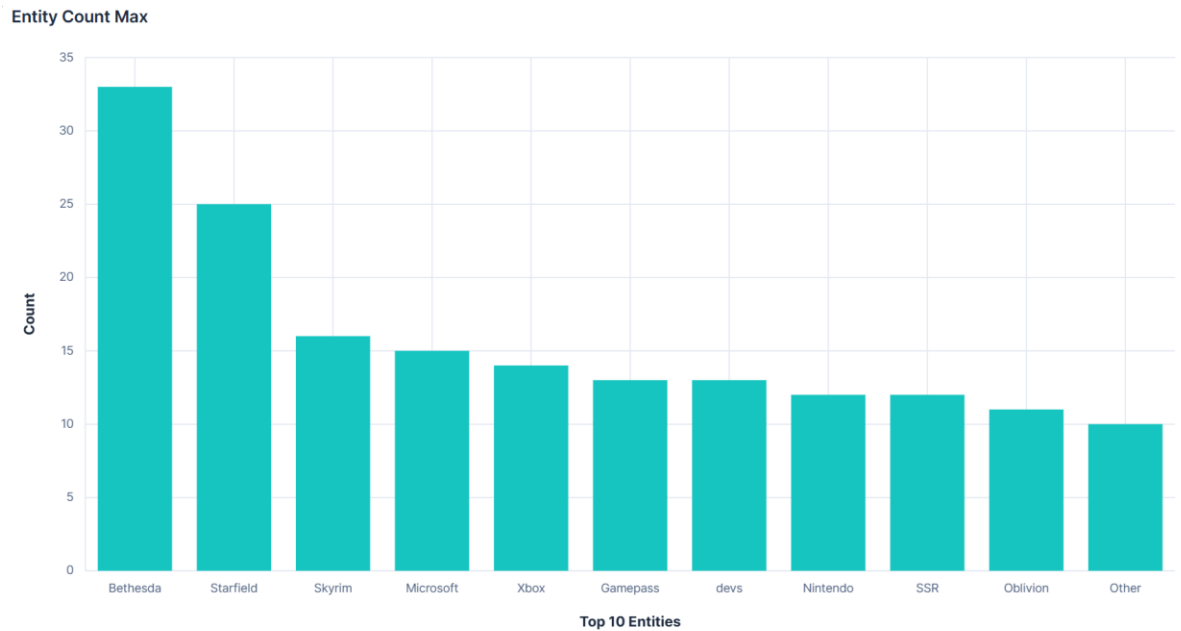

Note, “Other” is not a named entity, but instead refers to the highest count of all other words.

Snapshots at 30 minutes, 1 hour, 2 hours, and 4 hours are shown below.

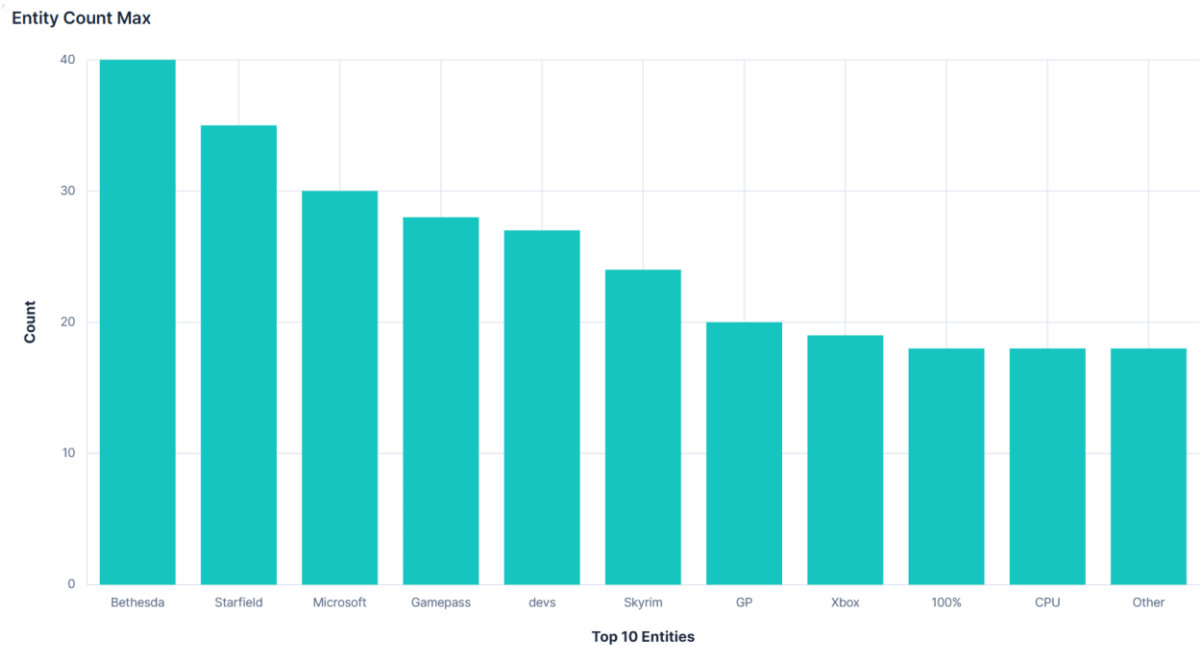

30 Minutes:

1 Hour

2 Hour

4 Hour
